FINAL TEST SUMMARY REPORT

Online Banking Application Testing

Application: ParaBank Demo Banking Application

Testing Approach: Manual Testing, Selenium Automation, API Testing and Regression Testing

1. Project Overview

The objective of this project was to test an online banking application and verify that its major banking features work according to expected requirements. Testing included manual test cases, Selenium with Python and PyTest, Postman API testing, regression testing and defect reporting.

2. Modules Tested

No.	Module
1	Login
2	Registration
3	Dashboard
4	Account Balance
5	Fund Transfer
6	Transaction History
7	Forgot Password

3. Testing Types Performed

• Functional Testing
• UI Testing
• Smoke Testing
• Sanity Testing
• Regression Testing
• API Testing using Postman
• SQL/Database validation concepts
• Automation Testing using Selenium + Python + PyTest

4. Test Execution Summary

Module	Result
Login	PASS
Registration	PASS
Dashboard	PASS
Account Balance	PASS
Fund Transfer	5 PASS / 1 FAIL
Transaction History	PASS
Forgot Password	PASS

Overall: All tested modules passed except the Zero Amount Fund Transfer scenario.

5. Bug Report

Field	Details
Bug ID	BUG_TRANSFER_001
Title	System allows transfer with zero amount
Module	Fund Transfer
Severity	Medium
Priority	Medium
Status	Open
Steps	Login → Transfer Funds → Select accounts → Enter Amount = 0 → Transfer
Expected	System should reject zero amount and display validation.
Actual	System successfully processed the zero amount transfer and displayed transfer completion.

6. API Testing Summary

API testing was performed using Postman. Valid and invalid account API scenarios, response data, status codes and response time were validated.

API Case	Result
Valid Account ID	PASS
Invalid Account ID	PASS
Invalid Endpoint	PASS
Response Data Validation	PASS
Status / Response Time Validation	PASS

7. Regression Testing Result

Regression testing was performed by re-executing the completed module test cases. Previously working functionality remained stable. The Zero Amount Fund Transfer defect remained reproducible and was recorded as an open defect.

8. Tools Used

• Selenium WebDriver
• Python
• PyTest
• Postman
• Excel
• Jira
• Git/GitHub

9. Final Conclusion

The Online Banking Application was successfully tested across its major available modules. Functional and API testing results were largely successful. One genuine functional defect was identified in the Fund Transfer module, where a zero amount transfer was accepted. The defect was documented with reproduction steps, expected result, actual result, severity, priority and status. This project demonstrates an end-to-end QA workflow covering test case design, execution, automation, API testing, regression testing and defect reporting.

Project Status: Testing Completed with 1 Open Defect
